

Project Process Model

Characteristics:

- * Modified Waterfall.
- * Complete requirements specification and design documentation.
- * Evolutionary Prototyping.
- * Active participation by the users during the development process.
- * Minor changes in requirements accommodated during the development process, but will not be documented in the SRS or the Design document, once these documents have been completed.
- * A project group can be in any phase of the development process and is not tied to the dates that the deliverables are due. For example, a group may be writing code during the design phase, which may either contribute to the partially functional prototype or the operational prototype.
